disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the brain of a patient, which comprises administering to the patient: (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (For receptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1.5 of Abeta; or (c) an agent that induces an immunogenic response against residues 1.3 to 7-11 of Abeta. The products of the invention have nootropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The Alzheimer's disease

                                                                                                                                                                                                                                                                                                                 ö
                                                                                                    disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the brain of a patient, which comprises administering to the patient: (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (Fc receptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta, or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have nootropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The methods are useful for prophylactic and therapeutic treatment of Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Amyloid deposit; APP; Abeta; brain; human; clearing response; nootropic; Fc receptor mediated phagocytosis; immunogenic response; neuroprotective; amyloid precursor protein; Alzheimer's disease.
                                Preventing or treating a disease associated with amyloid deposits, especially Alzheimer's disease, comprises administering amyloid specific antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Preventing or treating a disease associated with amyloid deposits, especially Alzheimer's disease, comprises administering amyloid specific antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel method of preventing or treating a disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the brain of a patient, which comprises

administering to the patient: (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (Foresponse dedated phagosytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta; or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have notropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The methods are useful for prophylactic and therapeutic treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The methods are useful for prophylactic and therapeutic treatment of Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel method of preventing or treating a disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the brain of a patient, which comprises administering to the patient: (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (For receptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta; or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have nootropic and neuroprotective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Preventing or treating a disease associated with amyloid deposits, especially Alzheimer's disease, comprises administering amyloid specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

It is based on a portion of cother amyloid related disorders in humans. It is based on a portion of inserting 1 or more amino acid residues or by substituting 1 or more amino acid residues or non-amino acid tragments. Vaccines of the invention acid residues or non-amino acid cagnedates synthesised from the unnatural D-configuration amino acids to peptides synthesised from the unnatural D-configuration amino acids to avoid the drawbacks of 'self' proteins. The all-D peptides need not be cagregated to be operative or immunogenic. They preferably interact with at least 1 region of an amyloid brotein, e.g. the beta-sheet region or at least 1 region of an amyloid-beta peptide, or their immunogenic fragments, protein conjugates, immunogenic derivative peptides and corresponding to residues 1-42, 1-40, 1-35, 1-28, 1-7, 10-16, 16-21 and corresponding to residues 1-42, 1-40, 1-35, 1-28, 1-7, 10-16, 16-21 and corresponding to residues lelicits a preferential TH-2 or TH-1 response, in AABBSC32-64. The vaccine elicits a preferential TH-2 or TH-1 response, or leated diseases may be localised amyloidosis, e.g. diabetes type II, related diseases, scrapie, cerebral amyloid angiopathy, and creuzfeld-Jakob disease, scrapie, cerebral amyloidosis associated with protein related diseases, or systemic amyloidosis associated with

```
The invention relates to an amyloid-targeting imaging agent comprising an amyloid targeting moiety, a linker moiety and a labelling moiety. The agent is of general formula A.t.(A. l.n. K) 2-A. l.a. b. (I) where z=0 - 1, A.t. = an amyloid targeting moiety, A.l.n. K=\overline{a} linker moiety, and A.l.a.b. a labelling moiety. Also included are imaging amyloid deposition or diagnosing an amyloid-related condition in a patient involving aministering (I) to the patient, and ultrasound imaging (I) in the patient to determine the presence of amyloid or amyloid-related condition; and a kit for preparing a radiopharmaceutical preparation comprising (i) a reducing agent, a buffering agent, a transfeleating agent, and instructions for the preparation and use of the radiopharmaceutical in the imaging of amyloid or an amyloid-related condition. The agents are used for imaging amyloid deposition and for diagnosing an amyloid related
                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New amyloid-targeting imaging agents useful for in vivo imaging amyloid plaques and/or for the treatment of amyloidosis disorders.
chronic infection (e.g. tuberculosis) or chronic inflammation (e.g. rheumatoid arthritis), familial Mediterranean fever (FMF) and systemic amyloidosis found in long-term haemodialysis patients
                                                                                                                                                             Gaps

The present invention describes a method (M1) for analysing cleavage of a polymer. M1 comprises: (a) providing a sample of the polymer, a portion of the polymer molecules having been labeled at a position on one side of the potential cleavage site with a first isotopic label and a portion of the potential cleavage site with a first isotopic label and a portion of the potential cleavage site with a second isotopic label; (b) incubating the sample under conditions suitable for cleavage at the potential cleavage site; and (c) analysing the mass(es) of any cleaved. Tragments by mass spectrometry and thereby determining whether and/or where cleavage has taken place. M1 is useful for analysing cleavage of a polymer, where the polymer is a linear polymer, and comprises a peptide or protein. Methods from the present invention can be used in discovering new or improved synthetic substrates for both known and unknown enzymes, c. s. e.g. enzymes identified from the human genome. The methods are also useful to identify the sequence origin, and in screening methods to
condition e.g. Creutzfeldt-Jakob disease (CJD), kuru, transmissible cerebral amyloidoses (transmissible virus dementias), familial CJD, scraple, transmissible mink encephalopathy, bovine spongiform encephalopathy (BSE), inflammation-associated amyloid, type II diabetes, primary amyloidosis, feline spongiform encephalopathy, non-transmissible cerebral amyloidosis, Alzheimer's disease, prion-mediated diseases, dialysis erleated amyloidosis, light chain-related amyloidosis, cerebral amyloid angiopathy. The agents are capable of crossing the blood-brain barrier and are capable of binding specifically to amyloid plaques. The present sequence is a peptide forming the amyloid targeting moiety of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Analyzing cleavage of polymer, by providing polymer sample, incubating the sample with labeled isotope for cleavage at potential cleavage site, and analyzing the masses of any uncleaved fragments by mass spectrometry
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 spectrometry; polymer; analysis; cleavage; substrate specificity;

               libraries, in in vivo/ex vivo/in vitro peptide, and in assaying methods for oligonuclectide or peptide sequencing and in measuring differential protein expression. The methods are useful for monitoring the cleavage of polypeptides or polyuclectides, and for determining optimal polymer substrates. ABP57505 to ABP57605 represent peptides used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cerebral amyloid angiopathy; amyloid disease; ankylosing spondylitis; psoriasis; Reiter's syndrome; Adult Still's disease; Bechet's syndrome; Crohn's disease; infection; leprosy; tuberculosis; carcinoma; nootropic; chronic pyelonephritis; ostcomyelitis; Whipple's disease; vasotropic; Hodgkin's lymphoma; neuroprotective; bronchiectasis; ophthalmological; ulcer; antiinflammatory; cytostatic; uropathic; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method for prevention and/or treatment of an amyloid-related disease which comprises administration of an all-D-amyloid-beta peptide. The method is used for preventing and/or treating Alzheimer's and other amyloid related disease e.g. cerebral amyloid angiopathy; for altering serum levels of amyloid-beta in a mammal and favours the clearance of soluble amyloid-beta or fibril amyloid-beta frothe mammal; and reducing or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid diseases including also used for treasting spondylitis, postiatis, juvenile chronic arthritis, ankylosing spondylitis, postiasis, psoriatic arthropathy, Reiter's syndrome, Adult Still's disease, Bechet's syndrome and Crohn's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  All-D-amyloid-beta peptide; Alzheimer's disease; rheumatoid arthritis;

Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
          infections (preferably leprosy, tuberculosis, bronchiectssis, decubitus ulcers, chronic pyelonephritis, osteomyelltis and Whipple's disease). Certain malignant neoplasms can also result in AA fibril amyloid deposits including Hodgkin's lymphoma, renal carcinoma, carcinomas of gut, lung and urogenital tract, basal cell carcinoma and hairy cell leukaemia. The present sequence is an Abeta peptide used to illustrate the method of the

The present invention describes compositions (C) comprising; (a) a first a second agent (a1) that ties (1) a papella or peptidomimetic that a second agent (a1) that is: (i) a peptide or peptidomimetic that a second agent (a1) that is: (i) a peptide or peptidomimetic that a second agent (a1) that is: (i) a peptide or peptidomimetic that condulates amyloid-beta instantion or induces a prophyladic or therapeutic immune response against amyloid-beta instantion of the contropic, neuroprofective, cerebroprofective, namedalar, antichyroid, vasotropic, cardiovascular, tranquilliser, uropathic, anticonvolsant, antidepressant, endocrime and hypnotic activities, curopathic, anticonvolsant, antidepressant, endocrime and hypnotic activities, neuroleptic, cardiant, antidepressant, endocrime and hypnotic activities, neuroleptic, cardiant, antidepressant, endocrime and hypnotic activities, neuroleptic, cardiant, antidepressant, endocrime and hypnotic activities, neuroleptic, antidepressant, endocrime and hypnotic activities, neuroleptic, damilial (hereditary) inid cognitive impalrment, camploid-beta related disease e.g. Altachmer's disease (including sporadic (including sporadic camploid angiopathy, hereditary cerebral haemorrhage, senile dementia, camploid-beta related angiopathy, hereditary cerebral haemorrhage, senile dementia, camploid-beta angiorial angioratic angioration associated with Altachmer's dementia, camploid-beta activities and participal angioration and condition (e.g. anxiety, a behavioural dysfunction (e.g. apathy, disease, memory loss, anxiety, a behavioural dysfunction (e.g. anning cagnession, or incontinence), a neurological condition (e.g. function (e.g. anning cattack or stroke, transient agraxia, agnosia, andition deficits, incoordination, gait disturbance, transient isohamic cattack or stroke, transient aperal solations and pressed model or services and camploid-beta deposits altered was condition in an aubject e.g. human having a genemial apprach or a psychological condition or a presentiling and part
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   amyloid-beta; amyloid-beta related disease;
amyloid-beta fibril formation; immune response; nootropic;
amyloid-beta fibril formation; immune response; nootropic;
neuroprotective; cerebroprotective; haemostatic; ophthalmological;
antichyroid; vasotroppic; cardiovascular; tranquilliser; uropathic;
anticonvulsant; anti-HIV; antiparkinsonian; muscular; neuroleptic;
cardiant; antidepressant; endocrine; hypnotic;
amyloid-beta fibril formation modulator; immune system modulator;
Alzheimer's disease; mild cognitive impairment;
mild-to-moderate cognitive impairment; vascular dementia;
cerebral amyloid angiopathy; hereditary cerebral haemorrhage;
senile dementia; Down's syndrome; inclusion body myositis;
age-related macular degeneration; hypothyroidism;
cerebrovascular disease; cardiovascular disease; memory loss; anxiety;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.

Disclosure; Page 95; 143pp; English.

The present invention describes compositions (C) comprising: (a) a first capen (a1) that prevents or treats amyloid-beta related disease; and (b) agecond agent (a2) that is: (i) a peptide or peptidomimetic that modulates amyloid-beta fibril formation or induces a prophylactic or therapeutic immune response against amyloid-beta intibits amyloid-beta (i) an immune system modulator that prevents or inhibits amyloid-beta (ii) an immune system modulator that prevents or inhibits amyloid-beta nutchylorid, vasotropic, cardiovascular, tranquilliser, or intophalant, antichyroid, vasotropic, cardiovascular, tranquilliser, or phthalmological, antichyroid, vasotropic, cardiovascular, tranquilliser, neuroleptic, cardiant, anticheral fibril formation modulators, and as immune system modulators. (C) can be used for preventing or treating an amyloid-beta related disease e.g. Alzelmer's disease (including sporad, or and can be used endial to preventing or treating an amyloid-beta related disease e.g. Alzelmer's disease (including sporad, or condition associated with Alzelmer's disease (including phycothyroids, creebral haemorrhage, senile dementia, own's syndrome, inclusion body myopidi, disease, dardiovascular disease, memory loss, anxiety, a behavioural disease, cardiovascular disease, memory loss, anxiety, a behavioural disease, cardiovascular disease, amportyphy or incontinence), a neurological condition (e.g. aptression, or incontinence), a neurological condition (e.g. Huttington's disease, amovor loss, anxiety, a behavioural disease, dementiant ischaemic they bodies altered muscle fone, selzures, sensory loss, anxiety, a peracity or cardior anyotrophic lateral alerness, attention deficit, frequent falls, syncope, neuroleptic sensitivity, normal pressure hydrocephalus subdural disease, or surpoke, transient alerness, attention deficit, frequent disease, or surpoke, transient alerness, attention deficits, demention, sand disorder, weight loss, psychopsical condition, sand disorder, weight loss, psychopsical condition, sand present invention

Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.

Disclosure; Page 95; 143pp; English.

The present introduction describes compositions (1) comparising; (a) a litter agent (a1) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidomimetic that modulates amyloid-beta fibril formation or induces a prophylactic or therapeutic immune seponse against amyloid-beta fibril formation; or (ii) an immune system modulator that prevents or inhibits amyloid-beta introduction. Also described is a kit comprising (C). (C) have nootropic, neuroprotective, cerebroprotective, haemostatic, coptual antithyroid, vasotropic, cardiovascular, tranquilliser, uropathic, anticonvulsant, anti-HIV, antiparkinsonian, muscular, curopathic, anticonvulsant, anti-HIV, antiparkinsonian, muscular, and as induced as amyloid-beta fibril formation modulators, and as immune system modulators. (C) can be used for preventing or treating and immune system modulators. (C) can be used for preventing or treating anyloid-beta related disease e.g. Alzheimer's disease (including sporadic (non-hereditary) or familial (hereditary)), mild cognitive impairment, mild-to-moderate cognitive impairment, vascular dementia, cerebral amyloid angiopathy, hereditary cerebral haemorrhage, senile dementia, as syndrome, includion described mild-beta disease (including hypothyroidism, cerebral and described mild-beta fibril formation disease, cardiovascular disease, cardiovascular disease, cardiovascular disease, memory loss, anxiety, a behavioural dysfunction (e.g. apathy, present invention describes compositions (C) comprising: (a) a first

deposits, involving the abnormal folding of a protein or peptide. The method involves administering an inhibitory peptide which prevents the abnormal folding or which dissolves existing amyloid or amyloid-like deposits, where the peptide comprises a sequence of 3-15 amino acid at least one of the 3 amino acids is a beta-sheet blocking amino acids where cesique selected from Pro, Gly, Asn and His. The present sequence cresique selected from Pro, Gly, Asn and His. The present sequence crepresents an anti-amyloid peptide, Abeta, which inhibits abnormal crepresents an anti-amyloid peptide, and capable of associating with a structural determinant on the protein or peptide to structurally block and inhibit the abnormal folding into amyloid or amyloid-like deposits. The method can be used for preventing, treating or detecting e.g. and inhibit the abnormal folding into amyloid or amyloid-like deposits. The method can be used for preventing, treating or detecting e.g. Alzheimer's dementia or disease, bown's syndrome, other amyloidosis disorders, human prion diseases such as Kuru, Creutzfeldt-Jakob disease, cerstanann-Straussler-Scheinker Syndrome, prion associated human neurodegenerative diseases or animal prion diseases such as scrapie, spongiform encephalopathy, transmissible mink encephalopathy and chronic wasting disease of mule deer and elk

polypeptide, particularly amyloid beta-peptide (Abeta). The method comprises providing a test sample comprising a polypeptide that contains a discordant helix in the form of an i-helix, contacting the test sample with a test compound and determining the rate of decrease in the amount of I-helix or the amount of I-helix present in the test sample. The method is useful for identifying a compound that stabilises an I-helical conformation of a discordant helix in a polypeptide. Such compounds are useful for decreasing the rate of formation of theta-strand structures between at least two discordant helix-containing polypeptides, and for treating amyloidogenic disorders such as amyloidosis in Alzheimer's conformation diseases (e.g. scrapie, bovine spongiform encephalopathy (BSE), Creutzfeld-Jacob disease (CUD)). Determining secondary structure binding to desired targets within parent polypeptides that bind to targets, by constructing and complexing peptides to metal ions to form metallopeptides and screening the metallopeptides.

Claim 194; Page 98; 165pp; English.

The invention relates to a method for identification and determination of target-specific folding sites in peptides and proteins. The invention also relates to a method for determining a secondary structure binding to desired targets within parent polypeptides that bind to targets, by constructing and complexing peptides to metal ions to form metallopeptides and screening the metallopeptides. The method is useful for determining secondary structure binding to desired target within parent polypeptide with primary structure that binds to the target, where

The invention describes an isolated inhibitory peptide (I) which interacts with a hydrophobic beta-sheet forming cluster of amino acid residues on a protein or peptide for amyloid or amyloid-like deposit formation, and inhibits or structurally blocks the abnormal folding of proteins and peptides into amyloid or amyloid-like deposits and into proteins and peptides into amyloid or amyloid-like deposits and into diseases associated with abnormal protein folding into amyloid or amyloid or like deposits or into pathological beta-sheet-rich precursors of such deposits, such as Alzheimer's disease, Down's syndrome, other amyloidosis disorders, human prion diseases, such as Kuru, Creutzfeldt-Jakob disease (CDD), Gerstmann-Straussler-Scheinker syndrome (GSS), prion associated human neurodegenerative diseases as well as animal prion diseases such as Novel inhibitory peptides which inhibit and structurally block abnormal folding of protein into amyloid or amyloid-like deposit and into pathological beta-sheet rich conformation, useful for treating Disclosure; Fig 9; 51pp; English. WPI; 2003-379012/36. Alzheimer's disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to inhibitory peptide comprising a portion of at least three amino acid residues and a sequence predicted not to adopt a beta-sheet structure that associates with a hydrophobic beta-sheet cluster on a protein or peptide involved in the abnormal folding into a brotein or peptide involved in the abnormal folding of the protein or peptide. The inhibitory peptide is useful for preparing a composition for preventing, treating or detecting disorders or diseases associated with amyloid-like fibril deposits e.g. Alzheimer's diseases prion related encephalopathies. The invention is also useful in gene therapy. The present sequence is amyloid-beta (Abeta) peptide. This peptide is used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New inhibitory peptide, useful for preparing a composition for diagnosing, preventing or treating disorders associated with amyloid-like fibril deposits, e.g. Alzheimer's disease, or prion related
                                                                                                                                                                                                                                                                                                                                 Amyloid-like fibril deposit; prion related encephalopathy; gene therapy;
Alzheimer's disease; amyloid-beta; Abeta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The invention relates to a method for prevention and/or treatment of an amyloid-related disease which comprises administration of an all-D-amyloid-beta peptide. The method is used for preventing and/or treating Alzheimer's and other amyloid related disease e.g. cerebral amyloid angiopathy; for altering serum levels of amyloid-beta in a mammal and favours the clearance of soluble amyloid-beta in a mammal and favours the clearance of soluble amyloid-beta in a mammal and reducing or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid diseases including inflammatory diseases e.g. rheumatoid arthritis, juvanile chronic arthritis, ankylosing spondylitis, psoriasis, psoriasis, psoriasis, carthropathy, Reiter's syndrome, Adult Still's disease, Bechet's syndrome and Crohn's Gisease. AA deposits are also produced as a result of chronic microbial infections (preferably leprosy, tuberculosis, bronchiectasis, decubitus ulcers, chronic pyelonephritis, osteomyelitis and Whipple's disease). Certain malignant neoplasms can also result in AA fibril amyloid deposits including Hodgkin's lymphoma, renal carcinomas of gut, lung and urogenital tract, basal cell carcinoma and hairy cell leukaemia. The including the sequence is an Abeta peptide used to illustrate the method of the

Sequence 20, Application US/09747408

Patent No. 6670399

GENERAL INPORMATION:
APPLICANT: Green, Allan M.
TITLE OF INVENTION: Compounds And Methods For Modulating
TITLE OF INVENTION: Cerebral Amyloid Angiopathy
FILE REFERENCE: US/09/747,408
CURRENT APPLICATION NUMBER: US/09/747,408
CURRENT FILING DATE: 2000-12-22
PRIOR APPLICATION NUMBER: 60/171,877

PRIOR FILING DATE: 1999-12-23

NUMBER OF SEQ ID NOS: 24

SOFTWARE: FastSEQ for Windows Version 4.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            88.2%; Score 30; DB 4; Length 9; 85.7%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 14, Application US/08630645

Patent No. 5948763

GENERAL INFORMATION:
APPLICANT: SOTO-JARA, Claudio
APPLICANT: BAUMANN, Marc
APPLICANT: FRANGIONE, BLas
TITLE OF INVENTION: THEREOF FOR TREATMENT OF DISORDERS OR DISEASES ASSOCIATED
TITLE OF INVENTION: WITH PROTEIN FOLDING INTO AMYLOID OR AMYLOID-LIKE DEPOSITS
NUMBER OF SEQUENCES:
ADDRESSEE: BROWDY AND NEIMARK
         GENERAL INFORMATION:

APPLICANT: Schenk, Dale B.

APPLICANT: Bard, Frederique

APPLICANT: Bard, Frederique

TITLE OF INVENTION: Prevention and Treatment of Amyloidogenic Disease

FILE REFERENCE: 15270J-004760US

FULE REFERENCE: 15270J-004760US

CURRENT APPLICATION NUMBER: US/09/724,551

CURRENT FILING DATE: 2000-11-28

PRIOR APPLICATION NUMBER: US/09/580,018

PRIOR APPLICATION NUMBER: US 09/322,289

PRIOR PRIOR PRILING DATE: 1999-05-28

NUMBER OF SEQ ID NOS: 77

SOFTWARE: PATENTIN VEY: 2.1

SEQ ID NO 23

LENGTH: 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                              FEATURE:
CTHER INFORMATION: Description of Artificial Sequence:10-mer peptide
CTHER INFORMATION: from AN1792 sequence (human Abeta42, beta-amyloid
CTHER INFORMATION: peptide)

Sequence 25, Application US/09988842

Patent No. 6716589

GENERAL INFORMATION:

APPLICANT: Johansson, Jan

ITILE OF INVENTION: DISCORDANT HELIX STABILIZATION FOR PREVENTION

TITLE OF INVENTION: DOF AMYLOID FORMATION

FILE REPERENCE: 12125-002-001

CURRENT APPLICATION NUMBER: US/09/988,842

CURRENT FILING DATE: 2001-11-19

PRIOR APPLICATION NUMBER: US 60/251,662

PRIOR APPLICATION NUMBER: US 60/251,662

PRIOR PILING DATE: 2000-11-20

NUMBER OF SEQ ID NOS: 26

NUMBER OF SEQ ID NOS: 26

SOFTWARE: FASELSEQ FOF Windows Version 4.0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ద
                                                                                                                                                                                                 AAW02310_W02332 represent the peptide portions of the beta-amyloid codilator compounds of the invention. Beta-amyloid peptide is a 4 kilodalten peptide that is the major protein component of amyloid plaques are present both in the brain lesions, and in the walls of cerebral blood vessels in Alzheimer's disease patients. The the walls of cerebral blood vessels in Alzheimer's disease patients. The amyloid modulators of the invention comprise an amyloid ogenic protein or peptide (such as this sequence) coupled directly or indirectly to at least one modifying group. The modifying group is preferably a cyclic, heterocyclic, or polycyclic group, such as declain, a cholamyl group, a biotin containing group, or a fluorescein containing group. These compounds then modulate the agreegation of these sequences to natural amyloid proteins or peptides when contacted with the natural amyloid proteins or peptides. The modulator compounds can be used in the treatment of disorders associated with the natural computed cardiac amyloidosis systemic senile amyloidosis, scrapie, isolated cardiac amyloidosis systemic senile amyloidosis, scrapie, bovine spongiform encephalopathy, familial amyloidosis, gardiac and other types of amyloidosis, heredicary cerebral hamorrhage computed the proposition of the modulators are also useful for the treatment of disorders associated with beta-amyloidosis, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô

```
The present invention describes beta-amyloid peptide (DAP) derivatives. The bAP derivatives inhibit aggregation of amyloidogenic proteins and peptides, specifically bAP, and their neurotoxicity, so are useful for treating and preventing any disease involving amyloidosis, specifically Alzheimer's disease but also Down's syndrome, familial amyloid polyneuropathy or cardiomyopathy, bovine spongiform encephalopathy and Creutzfeldt-Jakob disease. The bAP derivatives are also used to diagnose these diseases, in vitro or in vivo, by detecting binding of bAP to labelled bAP derivatives. Some bAP derivatives inhibit bAP aggregation even when bAP is present in molar excess. The present sequence represents a bAP derivative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nootropic; neuroprotective; antifibrillogenic; amyloidosis inhibition; cytoprotection; amyloid deposit degradation; amyloidosis disorder; Alzheimer's disease.

The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid protein
                                                                                                                                                                                                                                             Peptides AAB48474-B48496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid
                                                            Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic.

Sequence 6 AA;

```
The present sequence is tract of an arrive perturbation to the preparing vaccines for preventing or treating Alzhafmer's disease and other amyloid related disorders in humans. It is based on a portion of amyloid-beta peptide (see AABB2622), and may be modified by removing or inserting 1 or more amino acid residues, or by substituting 1 or more amino acid residues or non-amino acid fragments. Vaccines of the invention are produced using 'non-self' peptides synthesised from the unnatural D-configuration amino acid to avoid the drawbacks of 'self' proteins. The all-D peptides need not be avoid the drawbacks of 'self' proteins. The all-D peptides need not be aggregated to be operative or immunogenic. They preferably interact with a ggregated to be operative or immunogenic. They preferably interact with a ggregated to be operative or immunogenic derivative peptides and fragments, protein conjugates, immunogenic derivative peptides and fragments, protein conjugates, immunogenic derivative peptides and corresponding to residues 1.42, 1.40, 1.32, 1.28, 1.7, 10.16, 16.21 and corresponding to residues elicits a preferential TH-2 or TH-1 response, preventing fibrillogenesis and associated cellular toxicity. The amyloid related diseases may be localised amyloidosis, e.g. diabetes type II, neurodegenerative diseases, e.g. bovine spongleon encophalitis,

```

cc isolated cardiac amyloid, systemic senile amyloidosis, scrapie, bovine spongiform encephalopathy, Creutzfeldt-Jakob disease, adult onset diabetes, Gerstmann-Straussler-Scheinker syndrome, insulinoma, isolated atrial amyloidosis, idiopathic (primary) amyloidosis, myeloma or cc atrial amyloidosis, primary localised cutaneous macroglobulinaemia-associated with Sjogren's syndrome, reactive condular amyloidosis, familial Mediterranean Fever and familial cc (secondary) amyloidosis, familial Mediterranean Fever and familial emyloido nephropathy with urticaria and deafness (Muckle-Wells syndrome), hereditary cerebral haemorrhage with amyloidosis of Icalandic type, amyloidosis associated with long term haemodialysis, hereditary non-contropathic systemic amyloidosis of the thyroid, fibrinogen-associated hereditary carcinoma of the thyroid, fibrinogen-associated hereditary creaminal amyloidosis. The compound is capable of altering and inhibiting beta-mayloidosis. The compound is capable of altering and inhibiting beta-amyloidosis. The condulator. This sequence represents a fragment of the relative to the modulator. This sequence represents a fragment of the cell ong form of beta-amyloid modulator.

                                                                                                                                                                                                                                                                                  Synthetic.
                                                                                                                                                                                                                                                                Homo
Amyloid modulator useful for treating a disorder associated with amyloidosis, comprises an amyloidogenic protein and/or a peptide fragment coupled to a modifying group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes an amyloid modulator comprising an amyloidogenic protein and/or peptide fragment coupled to a modifying group so that the compound modulates the aggregation of natural amyloid proteins or peptides. The modulator is used for treating a disorder associated with amyloidosis e.g. familial amyloid polyneuropathy (Portuguese, Japanese and Swedish types), familial amyloid cardiomyopathy (Danish type),

                  The present invention describes an amyloid modulator compound (I) comprising an aggregation core domain and a modifying group attached to it. (I) has nootropic, neuroprotective, immunosuppressive, antimicrobial, antidiabetic, antipyretic, dermatological, cardiovascular, nephrotropic and auditory activities, and can be used as a natural bera amyloid aggregation (beta-AP). (I) are used in the manufacture of a medicament for the diagnosis or treatment of an amyloidogenic disease e.g. Alzheimer's diagnosis or treatment of an amyloidogenic disease e.g. Alzheimer's Down's syndrome individuals and in patients with hereditary cerebral hasmorrhage with amyloidogis, and for treating a disorder associated with amyloidosis, and for treating a disorder associated with coxicity of natural beta-AP aggregates to cultured neuronal cells. (I) not only reduces the formation of neurotoxic aggregates but also have the present sequence represents a beta-AP peptide, which is used in the present invention
                                                                                                                                                                                                                                                                           ö

The invention relates to an amyloid-targeting imaging agent comprising an amyloid targeting moiety, a linker moiety and a labelling moiety. The cagent is of gameral formula A.t. (A.l.n.k k.z.h.l.b.k l.a.b.l.) where z = 0 - 1; C. A.t. = an amyloid targeting moiety. Also included are Imaging amyloid deposition or diagnosing an amyloid-related condition in a patient involving cadministering (I) to the patient. Also included are Imaging amyloid deposition or administering (I) to the patient. On ultrasound imaging (I) in the patient to determine the presence of amyloid or amyloid-related condition. C. and a kit for preparating a radiopharmaceutical preparation comprising (I), a reducing agent, a buffering agent, a transchelating agent, and condition or amyloid or an amyloid-related condition. The agents are used for imaging amyloid deposition and for diagnosing an amyloid related condition e.g. Creutzfeldt-Jakob disease (CUD), kuru, transmissible creepral amyloidoses (transmissible virus dementias), familial CUD, creepral amyloidoses (transmissible virus dementias), familial CUD, creepral amyloidosis, faline spongiform encephalopathy, non-transmissible creepral amyloidosis, faline spongiform encephalopathy, non-transmissible creepral amyloidosis, Alzheimer's disease, prion-mediated diseases, dislaysis-related amyloidosis, light chain-related amyloidosis, light chain-related amyloidosis, amyloid angiopathy. The agents are capable of crossing the blood-brain cadent of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; islet amyloid polypeptide; IAPP; antifibrillogenic; amylin;

The present invention relates to a new method of inhibiting cerebral amyloid angiopathy. The new method of the invention involves contacting a blood vessel wall cell with an amyloid-beta40 inhibitor. The invention can be used for treating disease states characterised by cerebral amyloid angiopathy, particularly Alzheimer's disease, hereditary cerebral amyloid the mayloid of type and haemorrhagic stroke. The present sequence represents one of a group of poptides (AAU11648-AAU11669, AAU11910 & AAU11911) that were used in the invention as a carrier for the amyloid-beta40 (Abeta40) inhibitor. The Abeta40 inhibitor was used in the invention to treat a disease state characterised by
                                  The present invention relates to a new method of inhibiting cerebral amyloid angiopathy. The new method of the invention involves contacting a blood vessel wall cell with an amyloid-beta40 inhibitor. The invention can be used for treating disease states characterised by cerebral amyloid angiopathy, particularly Alzheimer's disease, hereditary cerebral amyloid hemorrhage with amyloidosis of the Dutch type and haemorrhagic stroke. The present sequence represents one of a group of peptides (AAU11648-AAU11659, AAU11911) that were used in the invention as a carrier for the amyloid-beta40 (Abeta40) inhibitor. The Abeta40 inhibitor was used in the invention to treat a disease state characterised by cerebral amyloid angiopathy (CAA)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ठ
                                                                                                                                                                                                 The present invention relates to antifibrillogenic agents (ABB83281-ABB83298), derived from human islet amyloid polypeptide (IAPP, ABB83307).

The present sequence is a peptide fragment of the amyloid-beta (Abbeta) peptide. Aggregation of IAPP, also known as amylin, or Abeta results in ceptides prevent fibril formation and amyloidosis. The antifibrillogenic peptides prevent fibril formation and amyloidosis and hence control folding or deposition of amyloid proteins. The antifibrillogenic peptides of the invention are useful in the manufacture of a medicament for inhibiting or treating amyloidosis or amyloid deposits e.g. Type I and Type II diabetes and/or for cytoprotection. They are also useful for treating senoidsis associated with chronic infection e.g. tuberculosis and chronic inflammation e.g. rheumatoid arthritis, and familial inflammation, fever, neurodegenerative diseases e.g. scrapie, bovine spongy form encephalitis, Creutzfeldt-Jacob disease, Alzhelmer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inhibiting cerebral amyloid angiopathy used for treating e.g. Alzheimer's disease comprises contacting blood vessel wall cell with amyloid-beta 40 inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Peptide #11, used as carrier for the amyloid-beta40 (Abeta40) inhibitor.
                                                         New antifibrillogenic peptide useful for inhibiting amyloidosis and/or for cytoprotection in the treatment of amyloidosis disorders e.g. type I
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Amyloid-beta40 inhibitor; Abeta40 inhibitor; cerebral amyloid an CAA; nootropic; neuroprotective; cerebroprotective; Alzheimer's cerebral haemorrhage; amyloidosis; haemorrhagic stroke.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ő

                                                                                                                                                                       ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method for prevention and/or treatment of an amploid-related disease which comprises administration of an all-D-amyloid-beta peptide. The method is used for preventing and/or treating Alzheimer's and other amyloid related disease e.g. cerebral amyloid anglost the amyloid related disease e.g. cerebral amyloid anglosthy; for altering serum levels of amyloid-beta in a mammal and favours the clearance of soluble amyloid-beta in amyloid-beta from the mammal; and reducing or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid diseases including inflammatory diseases e.g. rheumatoid athritis, juvenile chronic architis, ankylosing spondylitis, pooriasis, pooriatic arthropathy, carbritis, ankylosing spondylitis, pooriasis, psoriatic arthropathy, diseases. Ad deposits are also produced as a result of chronic microbial infections (preferably leprosy, tuberculosis, bronchiectasis, decubitus ulcers, chronic pyelonephritis, osteomyelitis and Whipple's disease). Certain malignant neoplasms can also result in AA fibril amyloid deposits including Hodgkin's lymphoma, renal carcinomas of gut, lung and urogenital tract, basal cell carcinoma and hairy cell leukaemia. The invention relates to a method for prevention and/or treatment of an application of supplication of an all-D amyloid-related disease which comprises administration of an all-D amyloid-bet applied. The method is used for preventing and/or treating halfor and other amyloid relates 6 amyloid-beta in a mammal and amyloid-beta or fibril amyloid-beta from the neammal; and reducing or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid diseases including inflammatory diseases e.g. rheumatoid arthritis, juvenile chronic arthritis, antylosing spondylitis, psoriasis, psoriatic arthropathy, Reiter's syndrome, Adult Still's disease, bechet's syndrome and Crohn's disease. AA deposits are also produced as a result of chronic microbial infections (preferably leprosy, tuberculosis, bronchiectasis, decubitus ulcers, chronic pyelonephritis, osteomyllitis and Whipple's disease).

Certain malignant neoplasms can also result in AA fibril amyloid deposits including Hodgkin's lymphoma, renal carcinoma, carcinomas of gut, lung

Antifibrillogenic amyloidosis inhibiting peptide.

amyloid-beta; amyloid-beta related disease; amyloid-beta fibril formation; immune response; nootropic; anteroprotective; cerebroprotective; haemostatic; ophthalmological; antithyroid; vasotropic; cardiovascular; tranquilliser; uropathic; anticonvulsant; anti-HIV; antiparkinsonian; muscular; neuroleptic; cardiant; antidepressant; endocrine; hypnotic; amyloid-beta fibril formation modulator; immune system modulator; Alzheimer's disease; mild cognitive impairment; mild-to-moderate cognitive impairment; vascular dementia; cerebral amyloid angiopathy; hereditary cerebral haemorrhage;

senile dementia; Down's syndrome; inclusion body myositis; ge-related macullar degeneration; hypothyroidism; cerebrovascular disease; cardiovascular disease; memory loss; anxiety; behavioural dysfunction; neurological condition; psychological condition; Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator. The present invention describes compositions (C) comprising: (a) a first Disclosure; Page 69; 143pp; English. 24-DEC-2003; 2003WO-CA002021 24-DEC-2002; 2002US-0436379P. 23-JUN-2003; 2003US-0482214P. (NEUR-) NEUROCHEM INT LTD. Gervais F, Bellini F; WPI; 2004-543342/52. vaccine antiqen. WO2004058239-A1 15-JUL-2004. Synthetic.

C The present invention describes compositions (C) comporising (a) a first cagent (al) that prevente or treate amyloid-beta related disease; and (b) a second agent (al) that is: (i) a peptide or peptidomimetic that c modulates amyloid-beta fibril formation, or induces a prophylatoric or therapeutic immune response against amyloid-beta fibril formation; or fibril formation, or fibril formation, or fibril formation, or fibril formation, or corresponse against amyloid-beta fibril formation. Also described is a kit compassing (C). (C) have fibril formation, antichyroid, vasotropic, cardiovascular, tranquilliser, uncorroursant, antichyroid, vasotropic, cardiovascular, tranquilliser, uncorroursant, antichyroid, vasotropic, cardiovascular, tranquilliser, uncorroursant, antichyrossant, endocrine and hypnotic activities, and can be used as amyloid-beta fibril formation modulators, and as immune system modulators. (C) can be used for preventing or treating an amyloid-beta related disease e, all antichyrosid, serior and conderate cognitive impairment, vascular dementia, cerebral complete are candition body myositis, age-related macular dementia, camploid angiopathy, hereditary or embravioural dysfunction (e.g. Huntington's desence anyotrophic lateral solebrowscular disease, cardiovascular dementia, correlation, or a condition associated with Alzheimer's disease (including hypothyroidsem, cerebrovascular disease, cardiovascular disease, amyotrophic lateral solebrows. Pastines, acquired immunodeficiency, with Lewy bodies, altered muscle tone, sensory loss variors, transient alerted andiocate, transient alerted muscle tone, sensory loss variors, transient alerted muscle tone, sensory loss variors, transient alerted muscle tone, sensory loss variors, transient alerted muscle condition (e.g. depression, delation, hallucination, sexual disorder, weight loss, pepthylory or a psychological condition (e.g. depression, delation, hallucination, escual disorder, weight loss, psychosis, a cillusion, hallucination, escual disorder, wei excessive guilt) in a subject e.g. human having a genomic mutation in an amyloid precursor protein gene, an ApoE gene, or a presentlin gene; an ApoE gene, or a presentlin gene; that mayloid-beta deposits. The present sequence represents a peptide that can be used as an antifibrillogenic amyloidosis inhibiting peptide in the exemplification of the present invention.

cc amyloid-beta related disease e.g. Alzheimer's disease (including sporadic (non-hereditary) or familial (hereditary)), mild cognitive impairment, amild-competate cognitive impairment, wascular demential, cerebral complete cognitive impairment, vascular demential, cerebral cown's syndrome, inclusion body myositis, age-related macular cown's syndrome, inclusion body myositis, age-related macular competing hypothyroidism, cerebral associated with Alzheimer's disease.

Cc degeneration, or a condition associated with Alzheimer's disease.

Cc (including hypothyroidism, cerebrowscular disease, cardiovascular disease, memory loss, anxiety, a behavioural dysfunction (e.g. apathy, aggression, or incontinence), a neurological condition (e.g. apathy, compasse) amyotrophic lateral sclerosis, acquired immunodeficiency, disease, amyotrophic lateral sclerosis, acquired immunodeficiency, parkinson's disease, aphsai, apraxia, agnosia, Pick disease, visual cristed deficits, incoordination, gelzures, sensory loss, visual cristed deficits, incoordination, gelzures, estimates, transient ischaemic stransient alertness, attention deficit, frequent falls, syncope, neuroleptic sensitivity, normal pressure hydrocephalus, subdural cristed, brain tumour, posttraumatic brain injury, or posthypoxic damage), or a psychological condition (e.g. depression, delusions, cristed modulater, behavioural dissorder, weight loss, psychosis, a sleep disturbance, insomnia, behavioural dissorder, weight loss, psychosis, a cressistory guill') in a subject e.g. human having a genemic mutation in an amyloid modulator peptide which is used in the exemplification of the present invention and the present invention of

KLVFFA

ò

The present invention describes compositions (C) comprising: (a) a first agent (a1) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidomimetic that modulates amyloid-beta fibril formation or induces a prophylactic or the prevents or induces a prophylactic or the response against amyloid-beta fibril formation; or (ii) an immune system modulator that prevents or inhibits amyloid-beta fibril formation. Also described is a kit comprising (C). (C) have notropic, neuroprotective, cerebroprotective, haemostatic, ophthalmological, antithyroid, vasotropic, cardiovascular, tranquilliser, uropathic, anticonvulsant, anti-HIV, antiparkinsonian, muscular, neuroleptic, cardiant, antidepressant, endocrine and hypnotic activities, and can be used as amyloid-beta fibril formation modulators, and as immune system modulators. (C) can be used for preventing or treating an Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator. The present invention describes compositions (C) comprising: (a) a first agent (a1) that prevents or treats amyloid-beta related disease; and (b) ca second agent (a2) that is: (i) a peptide or peptidonimetic that condulates amyloid-beta fibril formation, or induces a prophylactic or therapeutic immune response against amyloid-beta fibril formation, or therapeutic immune system modulator that prevents or inhibits amyloid-beta fibril formation, or citical information. Also described is a kit comprising (C) (C) have concropic, neuroprotective, cerebroprotective, haemostatic, or contropic, neuroprotective, cerebroprotective, haemostatic, contropic, neuroleptic, anticonvulsant, antidepressant, endocrine and hypnotic activities, or corporatic, anticonvulsant, antidepressant, endocrine and hypnotic activities, and can be used as amyloid-beta fibril formation modulators, and as amyloid-beta fibril formation modulators, and as amyloid-beta fibril formation modulators, and as amyloid-beta related disease e.g. Alzheimer's disease (including sporadic (non-hereditary) or familial (hereditary)), mild cognitive impairment, amyloid angiopathy, hereditary cerebral haemorrhage, senile dementia, camploid angiopathy, hereditary cerebral haemorrhage, senile dementia, commune syndrome, inclusion body myositis, age-related macular condition associated with Alzheimer's disease caliovascular conditions, or a condition associated with Alzheimer's disease conditions, cerebral disease, candiovascular disease, memory loss, anxiety, a behavioural dysfunction (e.g. Huntington's aggression, or incontinence), a neurological condition e.g. Huntington's

The present invention describes compositions (C) comprising (a) a first agent (a1) that prevents or tracts amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidomimetic that condutates amyloid-beta fibril formation, or induces a prophyladric or therapeutic immune response against amyloid-beta fibril formation, or therapeutic immune response against amyloid-beta fibril formation, or information. Also described is a kit comprising (C). (C) have incotropic, nauroprofective, cerebroprofective, haemostatic, cootraphic, anticonvulsant, anti-HIV, antiparkinsonian, muscular, uropathic, anticonvulsant, anti-HIV, antiparkinsonian, muscular, neuroleptic, cardinat, anti-HIV, antiparkinsonian, muscular, courpethic, anticonvulsant, antidepressant, endocrine and hypnotic activities, neuroleptic, cardinat, antidepressant, endocrine and hypnotic activities, compared as amyloid-beta fibril formation modulators, and can be used as amyloid-beta fibril formation modulators, and as immune system modulators. (C) can be used for preventing or treating an immune system modulators (C) and public moderate cognitive impairment, vascular dementia, crebral amyloid-beta related disease e.g. Altahèmer's disease (including sporadic (non-hereditary) or familial (hereditary) erelated macular cerebral haemorrhage, senite dementia, completed angiography, hereditary cerebral haemorrhage, senite dementia, completed angiography, hereditary cerebral haemorrhage, senite of disease, amyloid-beta relations, armiery, a behavioural dysfunction (e.g. purkinson's disease, alteral selerosis, acquired immunofeficiency, disease, amyloid-beta language, aphasia, apraxia, agnosia, person, or incontinance), a neurological condition (e.g. depression, or incontinance), an eurological condition (e.g. depression, delusions, alterad muscle tone, seizures, senite beta serviced intended person protein disease, anyloid-beta deposits. Human having a genomic mutation in an subject e.g. human having a genomic mutation in an eurological con
                                 Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
                                                                                                                                                                       The present invention describes compositions (C) comprising: (a) a first

The present invention describes compositions (C) comprising: (a) a first agent (11) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidonimetic that cagent (a1) that prevents or treats amyloid-beta fibril formation, or therapeutic immune response against amyloid-beta fibril formation, or (ii) an immune system modulator that prevents or inhibits amyloid-beta for interprotective, carebroprotective, haemostatic, (C) have noctropic, neuroprotective, carebroprotective, haemostatic, (C) have noctropic, neuroprotective, and sa a military antichardinant, mustage (C). (C) have noticipated, antichardinat, antichardinant, mustage sale (including sporadic and beta related disease e.g. Alzheimer's disease (including sporadic formation beta related disease e.g. Alzheimer's disease (including sporadic moderate cognitive impairment, vascular dementia, cerebral musus system modulators. (C) can be used for preventing or treating an amyloid-beta related disease e.g. Alzheimer's disease (including sporadic compression, or a condition associated with Alzheimer's disease (including phothyroids, erebrovascular disease, actions engals, appethy, hereditary cerebral haemorrhage, senile dementia, bown's syndrome, inclusion body myoaits, agnosia, profession, or incontinence), a neurological condition (e.g. apathy, disease, memory loss, anxiety, a behavioural dysfunction (e.g. apathy, disease, memory loss, anxiety, a pervolation in deficit, frequent falls, shringen a disease, appassal, apraxia, agnosia, pick disease, dementa stringers or incontinence), a neurological condition, as along fitted deficits, incoordination, gait disturbance, transient ischemmic attach deficits, incoordination, gait disturbance, transient ischemmic attach deficits, incoordination, gait disturbance, proper prevent all disturbance, proper prevent all disturbance, proper prevent all disturbance, proper proper anyloid, precurses, at appeal or anyloid, precurses, transient alexanders, and discrease anyloi
cardiant; antidepressant; endocrine; hypnotic; amwine system modulator; that amyloid-beta fibril formation modulator; immune system modulator; Alzheimer, assaase; mild cognitive impairment; mild-to-moderate cognitive impairment; vascular dementia; erebral amyloid angiopathy; hereditary cerebral haemorrhage; senile dementia; Down's syndrome; inclusion body myositis; age-related macular degeneration; hypothyroidism; cerebrovascular disease; cardiovascular disease; mamory loss; anxiety; behavioural dysfunction; neurological condition; psychological condition; vaccine antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Disclosure; Page 87; 143pp; English.

                       The peptide AAR88300 corresponds to residues 16-22 of beta-A4 was designed as a potential memory enhancing peptide but was found not to be amnestic. (Amnestic peptides are memory-enhancing at lower concentrations than those at which they cause amnesia)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to three new peptides which block the amnestic effects of amyloid beta protein and which can be used to ameliorate amnesia and other neurotoxicity in Alzheimer's disease caused by deposition of this protein. The peptides themselves are not amnestic or memory-enhancing. The new peptides are described in AAR87912, AAR87913 and AAR87914. The present sequence is an additional peptide tested in the process but found not to be active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New peptide(s) which block binding of amyloid beta protein - used for antagonising the amnestic effects of amyloid beta protein, partic. in Alzheimer's disease.
                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                             Test peptide used in study of antagonism of amyloid beta protein.

Advolvanta and personal control of anyloid personal cardians and in additator compounds of the invention. Beta-amyloid peptide is a 4 kilodalton peptide that is the major protein component of amyloid adduces are present both in the brain lesions, and in blades. Amyloid plaques are present both in the brain lesions, and in the walls of cerebral blood vessels in Alzheimer's disease patients. The amyloid modulators of the invention comprise an amyloidogenic protein or peptide (such as this sequence) coupled directly or indirectly to at least one modifying group. The modifying group is preferably a cyclic, heterocyclic, or polycyclic group, such as declain, a cholanyl group, a biotin containing group, or a fluorescein containing group. These compounds then modulate the aggregation of these sequences to natural amyloid proteins or peptides when contacted with the hatural amyloid proteins or peptides. The modulator compounds can be used in the treatment of disorders associated with amyloidosis, such as amyloid polymeuropathy, familial amyloid cardiac amyloidosis, speemic senile amyloidosis, scrapis, solated cardiac amyloidosis, speemic senile amyloidosis, gament familial amyloid cardiac amyloidosis, speemic senile amyloidosis, familial amyloid nephropathy with urticaria and deafines, hereditary cerebral haemorrhage and other types of amyloidosis. The modulators are also useful for the creatment of disorders associated with beta-amyloidosis, especially
                                                                                                                                                                     Beta-amyloid; modulator; amyloid plaque; brain lesion; amyloidosis; cerebral blood vessel; Alzheimer's disease; amyloidogenic protein; familial amyloid polyneuropathy; familial amyloid cardiomyopathy; isolated cardiac amyloidosis; systemic senile amyloidosis; insulinoma; bovine spongiform encephalopathy; Creutzfeldt-Jakob disease; urticaria; adult-onset diabetes; familial Mediterranean fever; therapy; deafness; scrapie; familial amyloid nephropathy; hereditary cepebral haemorrhage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ... The bar derivatives are also used to diagnose these diseases, in vitro or in vivo, by detecting binding of bar to labelled bar derivatives. Some bar derivatives inhibit bar aggregation even when bar is present in molar excess. The present sequence represents

Peptides AAB48474-B48496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore
                                                                                                                                                                 Peptides AAB48474-B48496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore besting treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nootropic; neuroprotective; antifibrillogenic; amyloidosis inhibition; cytoprotection; amyloid deposit degradation; amyloidosis disorder; Alzheimer's disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a chemical compound or composition comprising a peptide with a beta strand forming section and associates with a target beta-strand formed by a separate peptide-containing molecule. The invention is useful for inhibiting or reversing the association of target beta-strand, formed by Alzheimer's Abeta peptide into a beta-sheet or beta-fibre and the aggregation of proteins or

The present sequence is that of an all-D peptide suitable for use for preparing vaccines for preventing or treating Alzheimer's disease and confort related disorders in humans. It is based on a portion of amyloid related disorders in humans. It is based on a portion of amyloid-beta peptide (see AAB82622), and may be modified by removing or inserting 1 or more amino acid residues, or by substituting 1 or more can amino acid residues or non-amino acid fragments. Vaccines of the invention are produced using 'non-self' peptides synthesised from the unnatural D-configuration amino acids to avoid the drawbacks of 'self' proteins. The all-D peptides need not be aggregated to be operative or immunogenic. They preferably interact with at least 1 region of an amyloid-beta peptide, or their immunogenic fragments protein conjugates, immunogenic derivative peptides and immunogenic peptidemimetics. Examples include all-D peptides and immunogenic peptides and the all-D peptides and corresponding to residues 1-42, 1-40, 1-35, 1-28, 1-7, 10-16, 16-21 and immunogenic peptidemimetics. Examples include all-D peptides given to ABB82623-64. The vaccine elicits a preferential TH-2 or TH-1 response, or preventing fibrillogenesis and associated cellular toxicity. The amyloid corresponding to related diseases may be localised amyloid-being peptides and the all-D perion protein related diseases, e.g. browne spongiform encephalitis, crelated diseases may be localised amyloid-being peptides associated with currefeldt-Jakob diseases, e.g. bowine spongiform encephalitis, crelated diseases, scrapie, crebral amyloid angiopathy, and chronic infection (e.g. tuberculosis) or chronic infection dispaces.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Preventing/treating amyloid-related disease, especially Alzheimer's disease, comprises administering antigenic all-D peptide, eg. as vaccine, which elicits production of antibodies to prevent fibrillogenesis and associated cellular toxicity.
                                                                                                                                                                                                    Alzheimer's disease; amyloidosis; amyloid-related disease; vaccine;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptides AAB48474-B48496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid
useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid

The present sequence is that of an all-D peptide suitable for use in preparing vaccines for preventing or treating Alzheimer's disease and other amyloid related disorders in humans. It is based on a portion of amyloid-beta peptide (see AABS262), and may be modified by removing or inserting 1 or more amino acid residues, or by substituting 1 or more amino acid residues or non-amino acid fragments. Vaccines of the invention are produced using 'non-self' capturents. Vaccines of the invention are produced using 'non-self' capturents. Vaccines of 'self' proteins. The all-D peptides need not be aggregated to be operative or immunogenic. They preferably interact with at least 1 region of an amyloid-beta peptide. Or their immunogenic at least 1 region of an amyloid-beta peptide or their immunogenic fragments, protein conjugates, immunogenic derivative peptides and immunogenic peptidemimetics. Examples include all-D peptides and immunogenic peptidemimetics. Examples include all-D peptides and corresponding to residues 1-42, 1-40, 1-35, 1-28, 1-7, 10-16, 16-21 and corresponding to residues 1-42, 1-40, 1-35, 1-28, 1-7, 10-16, 16-21 and corresponding to residues lelicits a preferential TH-2 or TH-1 response, in ABB3623-64. The vaccine elicits a preferential TH-2 or TH-1 response, or preventing fibrillogenesis and associated cellular toxicity. The amyloid corrected diseases, scrapie, cerebral amyloid-adsesses, e.g. bovine spongiform encephalitis, cheuratelett-Jakob disease, e.g. bovine spongiform encephalitis, chronic infection (e.g. tuberculosis) or chronic infection (e.g. tuberculosis) or chronic infection (e.g. tuberculosis) or chronic infection (e.g. tuberculosis) crapic patients

macroglobulinaemia-associated amyloidosis, primary localised cutaneous nodular amyloidosis associated with Sjogren's syndrome, reactive (secondary) amyloidosis, familial Mediterranean Fever and familial amyloid nephropathy with urticaria and deafness (Muckle-Wells syndrome), hereditary cerebral haemorrhage with amyloidosis of Icelandic type, amyloidosis associated with long term haemodialaysis, hereditary non-neuropathic systemic amyloidosis (familial amyloidosis of Finnish type, amyloidosis associated with the medulary carcinoma of the thyroid, fibrinogen-associated hereditary renal amyloidosis and lysozyme-associated hereditary can amyloidosis. The compound is capable of altering and inhibiting betamyloid protein (beta-AP) aggregation of natural amyloidosinc proteins or peptides when contacted with a molar excess amount of natural beta-APs relative to the modulator. This sequence represents a fragment of the relative to the modulator. This sequence represents a fragment of the long form of beta-amyloid used in the creation of an amyloid modulator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Amyloid modulator compound useful for treatment of an amyloidogenic disease such as Alzheimer's disease comprises an aggregation core domain and a modifying group attached to it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Beta amyloid peptide; beta-AP; beta amyloid precursor protein; A-beta; APP-770; amyloid aggragation; amyloidogenic; Alsheimer's disease; noctropic; amyloid aggragation; ammunosuppressive; antimicrobial; auditory; antidiabetic; antipyretic; dermatological; cardiovascular; nephrotropic; amyloid aggregation inhibitor; neurotoxicity inhibitor; neurotoxicity inhibitor; Down's syndrome; amyloidogenic disease; beta amyloid deposition; amyloidosis; hereditary cerebral haemorrhage; familial amyloid polyneuropathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes an amyloid modulator compound (I) comprising an aggregation core domain and a modifying group attached to

antidiabetic, antipyretic, dermatological, cardiovassive, antimicrobial, antidiabetic, antipyretic, dermatological, cardiovascular, nephrotropic and auditory activities, and can be used as a natural amyloid aggregation inhibitor and an neurotoxicity inhibitor of natural beta amyloid aggregation continities, and can be used as matural beta amyloid aggregation continities, and amyloidosenic disease e.g. Alzheimer's diagnosis or treatment of an amyloidosenic disease e.g. Alzheimer's diagnosis or treatment of an amyloidosenic disease e.g. Alzheimer's constraint and other clinical occurrences of beta amyloid deposition such as monor and the manual partients with hereditary cerebral commorthage with amyloidosis, and for treating a disorder associated with hemorrhage with amyloid polyneuropathy. (1) reduces the conjuctory of natural beta-AP aggregates to cultured neuronal cells. (1) not only reduce the formation of neurotoxic aggregates but also have the present sequence represents a beta-AP peptider and absolute in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an amyloid-targeting imaging agent comprising an

cc amyloid targeting moiety, a linker moiety and a labelling moiety. The agent is of general formula A.t.A.l.n.k, z-A.l.a.b (1) where z = 0 - 1; cc agent is of general formula A.t.A.l.n.k = a.b. (1) where z = 0 - 1; cc = a labelling moiety. A.lso included are linker moiety; and A.l.a.b cd administering moiety. Also included are linker moiety, and A.l.a.b cd administering (1) to the patient, and ultrasound imaging (1) in the patient, a radiopharmaceutical preparation comprising (2) and a kit for preparing a radiopharmaceutical preparation comprising (1), a reducing agent, a buffering agent, a transchelating agent, and (1), a reducing agent, a buffering agent, a transchelating agent, and instructions for the preparation and use of the radiopharmaceutical in the imaging of amyloid or an amyloid-related condition. The agents are used for imaging amyloid deposition and for diagnosing an amyloid related condition e.g. Creuzfeldt-Jakob disease (3D), kuru, transmissible condition e.g. Creuzfeldt-Jakob disease (3D), kuru, transmissible condition e.g. Creuzfeldt-Jakob disease (3D), kuru, transmissible corpialopase, feline spongiform encephalopathy, non-transmissible creebral amyloidosis, feline spongiform encephalopathy, non-transmissible creebral amyloidosis, Alzheimer's disease, prion-mediated diseases, dialysis-related amyloidosis, Alzheimer's disease, prion-mediated amyloidosis, and are capable of binding specifically to amyloid plaques. The genter and are capable of binding specifically to amyloid plaques. The present sequence is a peptide forming the amyloid targeting moiety of the present equence is a peptide forming the amyloid targeting moiety of the

                                                                                                  The invention relates to an amyloid-targeting imaging agent comprising an amyloid targeting moiety, a linker moiety and a labelling moiety. The amyloid targeting moiety, a linker moiety and a labelling moiety. The control of agent is of general formula A L (A l n k) 2-A l a b (1) where z = 0 - 1; A t = an amyloid targeting moiety. Also included are imaging amyloid deposition or diagnosing an amyloid-related condition in a patient involving administering (1) to the patient, and ultrasound imaging (1) in the patient to determine the presence of amyloid or amyloid-related condition comprising (1), a reducing agent, a buffering agent, a transchelating agent, and control or instructions for the preparation and use of the radiopharmaceutical in the imaging of amyloid deposition and for diagnosing an amyloid related condition. The agents are condition e.g. Creutzfeldt-Jakob disease (CJD) kuru, transmissible condition e.g. Creutzfeldt-Jakob disease (CJD) kuru, transmissible condition e.g. Creutzfeldt-Jakob disease (CJD) kuru, transmissible creabral amyloidosis, feline spongiform encephalopathy, non-transmissible creabral amyloidosis, feline spongiform encephalopathy, non-transmissible creabral amyloidosis, light chain-related amyloidosis, creabral camyloidosis, light chain-related amyloidosis, cerebral amyloidosis, light chain-related amyloidosis, carbanic amyloid angiopathy. The agents are capable of crossing the blood-brain caparin sequence is a peptide forming the amyloid targeting moiety of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                              New amyloid-targeting imaging agents useful for in vivo imaging amyloid plaques and/or for the treatment of amyloidosis disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Amyloid; imaging agent; Creutzfeldt-Jakob disease; Kuru, CJD; transmissible cerebral amyloidosis; transmissible virus dementia; scrapie; transmissible wink encephalopathy; BSE; type II diabetes; bovine spongiform encephalopathy; inflammation associated amyloid; primary amyloidosis; feline spongiform encephalopathy; allammation associated amyloid; primary amyloidosis; feline spongiform encephalopathy; disease; blood-brain barrier; dialysis-related amyloidosis; light chain-related amyloidosis; eerebral amyloid angiopathy.

The invention relates to an amyloid-targeting imaging agent comprising an amyloid targeting moiety, a linker moiety and a labelling moiety. The cagent is of general formula A.t. (A.l.n.k) z-A.l.a.b. [1] where z = 0 - 1; A.t. = an amyloid targeting moiety. Also included are linker moiety; and A.l.a.b. c. al labelling moiety. Also included are linging amyloid deposition or diagnoshing an amyloid-related condition in a patient involving condition and moiety and altrasound imaging (1) in the patient to determine the presence of amyloid or amyloid-related condition; and a kit for preparing a radiopharmaceutical preparation comprising (1), and a kit for preparation and use of the radiopharmaceutical in the imaging of amyloid or amyloid-related condition. The agent are instructions for the preparation and tec of the radiopharmaceutical in the imaging of amyloid deposition and for diagnosing an amyloid related condition e.g. Creutzfldt-Jakob disease (CDD), kuru, transmissible condition e.g. Creutzfldt-Jakob disease (CDD), kuru, transmissible creebral amyloidoses (transmissible virus dementias), familial CDD, scrapie, transmissible mink encephalopathy, bovine spongiform encephalopathy, non-transmissible creebral amyloidosis, feline spongiform encephalopathy, non-transmissible creabral amyloidosis, feline spongiform encephalopathy, non-transmissible condition and are capable of binding specifically to amyloid plaques. The parsent and are capable of binding specifically to amyloid plaques. The present sequence is a peptide forming the amyloid targeting moiety of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      원
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 8
                                                                                                                                                                                                                                                         The present invention describes a novel peptide compound comprising Lys-
His-Tyr-beta-alaine, which has a memory modulating effect. The peptide
than obtoropic activity. The peptide can be used for the development of
topographic models useful to design and synthesise memory-enhancing and
tife-quality improving substances. The peptide compound restores the
life-quality improving substances. The peptide compound restores the
balance between excitatory and inhibitory systems in the brain, which is
cequired for optimal acquisition and retention of learning and helps to
correct defects in the balance that arise as a result of aging,
correct and injury. The substances exert recybernaticising effects on
infections and injury. The substances exert recybernaticising effects on
correct and the peptide structures. The substances mimic the action of
active peptides without having a peptide structure and do not subject to
degradation of peptide-splitting enzymes in the gut or other tissues. The
present sequence represents a human amyloid beta protein (beta-A4)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Inhibiting cerebral amyloid angiopathy used for treating e.g. Alzheimer's disease comprises contacting blood vessel wall cell with amyloid-beta 40 inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Amyloid-beta40 inhibitor; Abeta40 inhibitor; cerebra1 amyloid angiopathy;
CAA; nootropic; neuroprotective; cerebroprotective; Alzheimer's disease;
cerebra1 haemorrhage; amyloidosis; haemorrhagic stroke.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide #18, used as carrier for the amyloid-beta40 (Abeta40) inhibitor.
                                                                                                                                                                         New peptide compound useful for design of substances that enhance memory.
